## 7. Design Guidance

### 7.1. Module application circuit

Figure 11 Application circuit diagram

- IO2 is the module start control pin, which is in normal working mode at low level and in firmware burning mode at high level. The default low level inside the chip.
- IO2/NC, not available by default
- IO17/NC, available by default. The IO port is shared with the 32.768KHz crystal output PIN pin inside the module. If the module of the internal patch 32.768KHz crystal oscillator is customized, the IO is in NC state.

## 7.2. Recommend PCB footprint size

Figure 12 Recommend PCB footprint size

## 7.3. Antenna layout requirements

- The following two methods are recommended for the installation position on the mainboard:

Option 1: put the module on the edge of the motherboard, and the antenna area extends out of the edge of the motherboard.

- Option 2: put the module on the edge of the motherboard, the edge of the motherboard at the antenna position hollowed out an area.

**Figure 13 Antenna layout diagram**

## 7.4. Power supply

- Recommended 3.3V voltage, peak current over 500mA.
- Power supply is recommended to use LDO; if the DC-DC is used, the ripple is recommended to be controlled within 30mV
- DC-DC power supply circuit proposes to reserve the dynamic response capacitance to optimize the output ripple with large load changes.
- It is recommended to add ESD devices to the 3.3V power interface.

**Figure 14 DC-DC step-down circuit diagram**

## 7.5. GPIO

- There are some IO ports on the periphery of the module. If you need to use it, it is recommended to connect a 10-100 ohm resistor in series with the IO port. This inhibits overshoot and makes both sides level more stable. It is helpful for EMI and ESD.
- For special I/O ports to be pulled up and down, refer to the usage instructions in the specifications, which may affect the module startup configuration.
- The IO port of the module is 3.3V. If the IO level of the main control and the module do not match, a level conversion circuit needs to be added.
- If the I/O port is directly connected to a peripheral port or terminals, for example, a pin row, reserve an ESD device near the terminal of the I/O cable.

Figure 15 Level convert circuit

## 8. Storage conditions

Products sealed in moisture-proof bags should be stored in a non-condensing atmosphere of <40 °C /90%RH.

The module has a moisture sensitivity rating of MSL 3.

After the vacuum bag is opened, it must be used within 168 hours at 25±5°C/60%RH, otherwise it needs to be baked before it can be put on line again.
